## **1.0 INTRODUCTION**

Providence Engineering and Environmental Group LLC (Providence) was contracted by Cleco Cajun LLC (Cleco) to perform the 5-year periodic review of the Inflow Design Flood Control System Plan of the Bottom Ash Basin at Cleco's Big Cajun II (BCII) Power Plant.

The Coal Combustion Residual (CCR) regulations at 40 CFR 257.82 established requirements for owners and operators to design, construct, operate and maintain an inflow design flood control system that must adequately manage the flow into and the flow from the CCR unit during and following the peak discharge. CB&I Environmental & Infrastructure, Inc. (CB&I) conducted the initial Inflow Design Flood Control System Plan and placed it in the facility operating record on October 17, 2016.

This 5-year periodic review for the Inflow Design Flood Control System Plan pertains to the Bottom Ash Basin that is utilized for the Big Cajun II coal-fired generation unit. BCII is located at 10431 Cajun II Road, New Roads, Pointe Coupee Parish, Louisiana. A site location map showing the BCII Power Plant is included as **Figure 1**. The Bottom Ash Basin is shown in **Figure 2**.

Bottom ash from Boiler Unit No. 1 is currently sluiced to the southern part of the Bottom Ash Basin. Also, the clarifier sediments are piped to the southeast corner of the Bottom Ash Basin.

The BCII facility contains five solid waste management units that operate under the Louisiana Department of Environmental Quality (LDEQ) solid waste permit P-0108R2. The Fly Ash Basin and the Bottom Ash Basin are required to comply with the requirements of the CCR regulations. The Primary Treatment Pond, Secondary Treatment Pond and the Rainfall Surge Pond are not subject to the CCR regulations. These solid waste management units are shown on **Figure 3**.

## **2.0 INFLOW DESIGN FLOOD CONTROL SYSTEM PLAN**

Per the CCR regulations, the Inflow Design Flood Control System Plan must contain documentation, including supporting engineering calculations that the inflow design control system has been designed and constructed to:

- Adequately manage flow into the CCR unit during and following the peak discharge of the inflow design flood,
- Adequately manage flow from the CCR unit to collect and control the peak discharge resulting from the inflow design flood, and
- Handle discharge from the CCR unit in accordance with the surface water requirements in 40 CFR 257.3-3.

The initial and 5-year periodic review of the hazard potential classification determined that the Bottom Ash Basin is a low hazard potential CCR surface

impoundment, therefore, the inflow design flood is based on the 100-year flood as noted in 40 CFR 257.73(a)(2) or 257.74(a)(2).

All surface water runoff from the Fly Ash Basin and Bottom Ash Basin is collected and transported by gravity to the Rainfall Surge Pond. All water collected in the Rainfall Surge Pond is treated in the solid waste surface impoundments permitted under the Louisiana Pollutant Discharge Elimination System (LPDES) Permit No. LA0054135. The inflow design flood control system and surface water impoundment features are shown in **Figure 3**.

As noted in CB&I's 2016 report, rain falling on the Fly Ash Basin will fall on either the in-place fly ash and then run off to the open water area of the Fly Ash Basin or on the open water. The rainfall runoff exits from the northeast corner of the basin. A swale (Item 1) channels the runoff toward the Fly Ash Basin drainpipe (Item 2). Rainfall runoff leaves the Fly Ash Basin by passing through a concrete entrance box and then through a 30-inch diameter, schedule 40 steel pipe. The Fly Ash Basin drainpipe passes through the levee that separates the Fly Ash Basin and the Bottom Ash Basin and discharges into a drainage swale (Item 3) in the Bottom Ash Basin. This swale runs from west to east near the north levee. This swale carries runoff from the Fly Ash Basin drainpipe and also collects and channels the surface runoff from the Bottom Ash Basin to the Bottom Ash Basin exit weir (Item 4). The Bottom Ash Basin exit weir serves as an inlet to the Bottom Ash Basin drainpipe (Item 5). This drainpipe is a 30-inch diameter, schedule 40 steel pipe that carries the combined Fly Ash Basin and Bottom Ash Basin surface runoff through the north levee. The flow of water is controlled with a 30-inch butterfly valve (Item 6). Item 7 is a continuation of the 30-inch drainpipe, which carries the runoff from the Bottom Ash Basin through a junction box (Item 8) and to the drainpipe discharge area (Item 9) in the Rainfall Surge Pond. The discharge apron is fitted with a concrete apron to prevent erosion caused by the discharge of wastewater.

Items 1 through 9 described above are the elements of the Fly Ash Basin and Bottom Ash Basin runoff collection system. Since the discharge point (Item 9) is the lowest elevation point in the system, all movement of surface runoff is by gravity. The collection system was designed without pumps to minimize the operation and maintenance costs and to avoid the drainage problems that could arise from downtime due to equipment failure or maintenance.

Items 10 through 14 are components of the LPDES treatment ponds. Item 10 is Lift Station No. 1. Its purpose is to pump the water from the Rainfall Surge Pond up to the Primary Treatment Basin. Item 11 is the chemical storage area. Water treatment chemicals may be added to the wastewater at this point to adjust the pH or to reduce suspended solids to the limits defined in the LPDES permit. Item 12 is the 24-inch diameter steel pipe that is used to carry the water from the Lift Station No. 1 to the Primary Treatment Pond. Item 13 is an air mix chamber that is connected to the end of a 48-inch diameter steel pipe. Water flows from the Primary Treatment Pond through the pipe, over the air mix chamber and into the Secondary Treatment Pond. The air mix chamber adds oxygen to the wastewater

flowing over it. Item 14 is Lift Station No. 2, which pumps the treated wastewater to the Mississippi River in accordance with the LPDES permit.

The Bottom Ash Basin is currently operated in the same manner that it was in 2016, when the initial Inflow Design Flood Control System Plan was completed. Based on the calculations shown in **Appendix A**, Providence has determined that this Inflow Design Flood Control System Plan for the Bottom Ash Basin is adequate for the facility.

### **3.0 CONCLUSIONS**

Based on the review of the calculations for the Inflow Design Flood Control System Plan, the Bottom Ash Basin at Cleco's Big Cajun II Power Plant has been designed in accordance with good engineering practice and meets the requirements of 40 CFR 257.82 and that this Plan is adequate for the facility. **Appendix B** contains a P.E. Certification that attests to the 5-year periodic review of the Inflow Design Flood Control System Plan for the Bottom Ash Basin.

**Summary for Pond 2P: Bottom Ash Storage**

[81] Warning: Exceeded Pond 1P by 4.24' @ 119.95 hrs

Inflow Area = 229.847 ac, 43.39% Impervious, Inflow Depth > 14.95"

Inflow = 482.75 cfs @ 12.35 hrs, Volume= 286.300 af

Outflow = 15.00 cfs @ 120.00 hrs, Volume= 140.073 af, Atten= 97%, Lag= 6,458.9 min

Primary = 15.00 cfs @ 120.00 hrs, Volume= 140.073 af

Routing by Stor-Ind method, Time Span= 0.00-120.00 hrs, dt= 0.05 hrs

Starting Elev= 35.00' Surf.Area= 38.649 ac Storage= 126.623 af

Peak Elev= 38.67' @ 120.00 hrs Surf.Area= 41.062 ac Storage= 272.868 af (146.246 af above start)

Plug-Flow detention time= 6,661.9 min calculated for 13.407 af (5% of inflow)

Center-of-Mass det. time= 875.7 min ( 3,719.5 - 2,843.8 )

**Summary for Pond 3P: Rainfall Surge Pond Storage**

[79] Warning: Submerged Pond 2P Primary device # 1 OUTLET by 1.52'

Inflow Area = 248.639 ac, 47.67% Impervious, Inflow Depth > 7.70"  
 Inflow = 267.11 cfs @ 12.02 hrs, Volume= 159.582 af  
 Outflow = 42.96 cfs @ 12.54 hrs, Volume= 139.776 af, Atten= 84%, Lag= 30.8 min  
 Primary = 42.96 cfs @ 12.54 hrs, Volume= 139.776 af

Routing by Stor-Ind method, Time Span= 0.00-120.00 hrs, dt= 0.05 hrs  
 Peak Elev= 28.52' @ 12.54 hrs Surf.Area= 16.176 ac Storage= 23.975 af

Plug-Flow detention time= 894.5 min calculated for 139.752 af (88% of inflow)  
 Center-of-Mass det. time= 416.3 min ( 3,770.7 - 3,354.3 )

**P.E. CERTIFICATION**

# **BIG CAJUN II POWER PLANT BOTTOM ASH BASIN**

5-YEAR PERIODIC REVIEW – INFLOW DESIGN FLOOD CONTROL SYSTEM PLAN

# PROFESSIONAL ENGINEER CERTIFICATION

I hereby certify that I have performed the 5-year periodic review of the Inflow Design Flood Control System Plan for Cleco Cajun LLC (Cleco) Big Cajun II Power Plant Bottom Ash Basin in accordance with the CCR requirements at 40 CFR 257.82. This 5-year periodic review of the Inflow Design Flood Control System Plan has determined that the Bottom Ash Basin has been designed in accordance with good engineering practice and meets the requirements of 40 CFR 257.82 and that this Plan is adequate for the facility.
