1 HydroCad Report

1.0 INTRODUCTION

The Ash Management Landfill at the Cleco Brame Energy Center (BEC) operates under solid waste permit P-0379-R1M3 issued by the Louisiana Department of Environmental Quality (LDEQ). On October 11, 2021, the LDEQ approved a minor modification for design changes to Cell 4 to comply with CCR design requirements. These changes included raising the excavation grades in Cell 4, changes to final waste grades, raising the perimeter levee elevations, and reorientation of the leachate collection trenches.

The ash management landfill is surrounded by a perimeter ditch and levee system which prevents runoff from the area from entering the operational areas of the facility. To collect the waters permeating the waste material, the leachate collection system is in place. This water collected in the leachate collection system and stormwater runoff from the ash management landfill is routed to the Leachate Collection/Runoff pond. This water is treated before release through an LPDES permitted outfall.

On April 17, 2015, the United States Environmental Protection Agency (EPA) issued the final version of the federal coal combustion residuals rule (CCR Rule) to regulate the disposal of CCR materials generated at coal-fired units. The rule is being administered as part of the Resource Conservation and Recovery Act (RCRA, 42 U.S.C. §6901 et seq.), using the Subtitle D approach.

Per 40 CFR §257.81(c)(5), Cleco must obtain certification from a qualified professional engineer that the run-on and runoff systems for Cell 4 meet the requirements of 40 CFR 257.81(c)(1-5). This certification is included in **Appendix A**.

2.0 REQUIREMENTS FOR RUN-ON AND RUNOFF CONTROL SYSTEMS

This plan will document how the run-on and runoff systems have been designed and constructed to meet the criteria in accordance with §257.81(c)(1) as supported by appropriate engineering calculations for CCR units. The run-on control system must be designed to prevent flow on the active portion of the CCR unit during the peak discharge from a 24-hour, 25-year storm; and the runoff control system from the active portion of the CCR unit must be designed to collect and control at least the water volume resulting from a 24-hour, 25-year storm, in accordance with §257.3-3, detailing discharges to surface waters. This plan will be revised every five years in accordance with §257.81 (c)(4).

3.0 RUN-ON AND RUNOFF CONTROL SYSTEMS

Run-on is controlled by the construction of the perimeter levee system around Cell 4 of the ash management landfill. The perimeter levee has been constructed to minimum elevation of 122' NAVD 88. Ground surface elevations in the immediate vicinity of Cell 4 range from 110' to 105' NAVD 88. Sufficient freeboard exists to prevent run-on from outside of Cell 4 from entering the operational footprint of the CCR Unit.

Runoff from Cell 4 is controlled by the interior ditch at the toe of the slope of the waste. This interior ditch intercepts stormwater runoff at the base of the slope and routes the runoff to the Leachate Collection/Runoff pond. A HydroCAD model of the interior ditch was developed, and the subsequent calculations were used to support that the interior ditch has the capacity to handle the stormwater

runoff generated from a 25-year, 24-hour storm event (10.10 inches). These calculations and HyrdoCAD report are included in **Attachment 1**. For the HydroCAD analysis, only the runoff from Cell 4 was considered and only the section of interior ditch surrounding Cell 4 was analyzed for capacity. Cell 4 is the only disposal cell receiving CCR materials for disposal. The runoff from Cell 4 was computed using a uniform area weighted average slope and the channel dimensions were averaged using four cross-sections and remain constant for the analysis. The soil was considered to be a hydrologic classification of C and the Manning's n values are correlated to bare earth. Cell 4 was split in half represented by two subcatchments and the interior ditch was also modeled in two sections draining from a high point at the Northwest and the interior ditch flowing to the Southeast.

4.0 CONCLUSIONS

The results of the model show that the south side of the interior ditch has a design storage capacity of 105,316 cubic-feet and reached a peak storage of 28,302 cubic-feet during a SCS Type III 25-year 24-hour storm event. Similarly, the north side of the interior ditch has a design storage capacity of 92,722 cubic-feet and reached a peak storage of 19,780 cubic feet during a SCS Type III 25-year 24-hour storm event.

Based on the review of design criteria for the perimeter levee and interior ditch system and the included calculations, Cleco has determined that the run-on/runoff system for Cell 4 meets the criteria outlined in 40 CFR 257.81 (c)(1-5). This report will be placed in the facility's operating record in accordance with 40 CFR 257.107(f) and will be made available on the facility's publicly accessible internet site in accordance with 40 CFR 257.107(f).

APPENDIX A
CERTIFICATION

APPENDIX A

CERTIFICATION

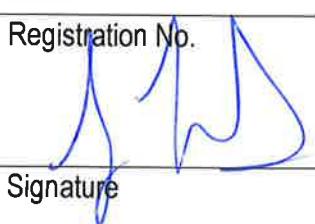

I certify that this Run-on/Runoff Control System Plan fulfills the minimum requirements of 40 CFR 257.81(c)(1-5), as applicable. This certification is based on my review of the Cleco Brame Run-on/Runoff Control System Plan and operational information about the CCR units.
